AgraLiners is a leading manufacturer of flexible membrane fertilizer tank liners for the Agricultural Industry for both primary and secondary containment of hazardous liquids.

Our system uses a tested, proven, PVC membrane inside the tank, which becomes the primary containment for the liquid; with the rigid tank being the secondary containment. This fertilizer tank liner system is approved by most state departments of agriculture.

We have found over the years that a liner can have a life expectancy of ten to fifteen years, or more, in 28 and 32 percent nitrogen and 10-34-0 service. Life expectancy is dependent of course on the care and maintenance of the liners. Reducing solids build-up and maintaining a maximum temperature of 140 degrees F, extends the life of the liner. In addition, a 60-mil bottom can be supplied for those requesting a heavier liner bottom.
**Customized Fertilizer Tank Liners**

Increasing environmental concerns are requiring secondary containment for hazardous liquids. Flexible membrane fertilizer tank liners can be custom-fitted for most vessels as a low cost, quick, permanent solution for primary / secondary containment with minimal down time and preparation.

**Primary, Secondary Fertilizer Tank Liners**

AgraLiners internal liners are mechanically held and become the primary containment with the tank becoming the secondary containment. Our factory trained and OHSA compliant crews can install a fertilizer tank liner system in a matter of days to reduce loss of production. Utilizing flat-faced flanging systems, your tank piping can be integrated into our lining systems.
